AZAINDOLES

This invention is directed to substituted azaindoles, their preparation, pharmaceutical compositions containing these compounds, and their pharmaceutical use in the treatment of disease states capable of being modulated by the inhibition of the protein kinases.

Protein kinases participate in the signalling events which control the activation, growth and differentiation of cells in response to extracellular mediators and to changes in the environment. In general, these kinases fall into several groups; those which preferentially phosphorylate serine and/or threonine residues and those which preferentially phosphorylate tyrosine residues [S.K.Hanks and T.Hunter, FASEB. J., 1995, 9, pages 576-596]. The serine/threonine kinases include for example, protein kinase C isoforms [A.C.Newton, J. Biol. Chem., 1995, 270, pages 28495-28498] and a group of cyclin-dependent kinases such as cdc2 [J.Pines, Trends in Biochemical Sciences, 1995, 18, pages 195-197]. The tyrosine kinases include membrane-spanning growth factor receptors such as the epidermal growth factor receptor [S.Iwashita and M.Kobayashi, Cellular Signalling, 1992, 4, pages 123-132], and cytosolic non-receptor kinases such as p56lck, p59fyn, ZAP-70 and csk kinases [C.Chan et. al., Ann. Rev. Immunol., 1994, 12, pages 555-592].

Inappropriately high protein kinase activity has been implicated in many diseases resulting from abnormal cellular function. This might arise either directly or indirectly, for example by failure of the proper control mechanisms for the kinase, related for example to mutation, over-expression or inappropriate activation of the enzyme; or by over- or underproduction of cytokines or growth factors also participating in the transduction of signals upstream or downstream of the kinase. In all of these instances, selective inhibition of the action of the kinase might be expected to have a beneficial effect.

Syk is a 72-kDa cytoplasmic protein tyrosine kinase that is expressed in a variety of hematopoietic cells and is an essential element in several cascades that couple antigen receptors to cellular responses. Thus, Syk plays a pivotal role in signalling of the high affinity IgE receptor, FcεR1, in mast cells and in receptor antigen signalling in T and B lymphocytes. The signal transduction pathways present in mast, T and B cells have common features. The ligand binding domain of the receptor lacks intrinsic tyrosine kinase activity. However, they interact with transducing subunits that contain immunoreceptor tyrosine based activation motifs (ITAMs) [M.Reth, Nature, 1989, 338, pages 383-384]. These motifs are present in both the β and γ subunits of the FcεR1, in the ξ-subunit of the T cell receptor (TCR) and in the IgGα and IgG β

subunits of the B cell receptor (BCR). [N.S.van Oers and A.Weiss, *Seminars in Immunology*, 1995, 7, pages 227-236] Upon binding of antigen and multimerization, the ITAM residues are phosphorylated by protein tyrosine kinases of the Src family. Syk belongs to a unique class of tyrosine kinases that have two tandem Src homology 2 (SH2) domains and a C terminal catalytic domain. These SH2 domains bind with high affinity to ITAMs and this SH2-mediated association of Syk with an activated receptor stimulates Syk kinase activity and localises Syk to the plasma membrane.

In Syk deficient mice, mast cell degranulation is inhibited, suggesting that this is an important target for the development of mast cell stabilising agents [P.S.Costello, *Oncogene*, 1996, 13, pages 2595-2605]. Similar studies have demonstrated a critical role for Syk in BCR and TCR signalling [A.M.Cheng, *Nature*, 1995, 378, pages 303-306, (1995) and D.H.Chu et al., *Immunological Reviews*, 1998, 165, pages 167-180]. Syk also appears to be involved in eosinophil survival in response to IL-5 and GM-CSF [S.Yousefi et al., *J. Exp. Med.*, 1996, 183, pages 1407-1414]. Despite the key role of Syk in mast cell, BCR and T cell signalling, little is known about the mechanism by which Syk transmits downstream effectors. Two adaptor proteins, BLNK (B cell Linker protein, SLP-65) and SLP-76 have been shown to be substrates of Syk in B cells and mast cells respectively and have been postulated to interface Syk with downstream effectors [M.Ishiai et al., *Immunity*, 1999, 10, pages 117-125 and L.R.Hendricks-Taylor et al., *J.Biol. Chem*, 1997, 272, pages 1363-1367]. In addition Syk appears to play an important role in the CD40 signalling pathway, which plays an important role in B cell proliferation [M.Faris et al., *J.Exp. Med.*, 1994, 179, pages 1923-1931].

Syk is further involved in the activation of platelets stimulated via the low-affinity IgG receptor (Fc gamma-RIIA) or stimulated by collagen [F.Yanaga et al., *Biochem. J.*, 1995, 311, (Pt. 2) pages 471-478].

Focal adhesion kinase (FAK) is a non-receptor tyrosine kinase involved in integrin-mediated signal transduction pathways. FAK colocalizes with integrins in focal contact sites and FAK activation and its tyrosine phosphorylation have been shown in many cell types to be dependent on integrins binding to their extracellular ligands. Results from several studies support the hypothesis that FAK inhibitors could be useful in cancer treatment. For example, FAK-deficient cells migrate poorly in response to chemotactic signals and overexpression of C-terminal domain of FAK blocks cell spreading as well as chemotactic migration (Sieg et al, *J. Cell Science*, 1999, 112, 2677-2691; Richardson A. and Parsons T., *Cell*, 1997, 97, 221-231) ; in addition, tumor cells treated with FAK antisense oligonucleotides lost their attachment and underwent apoptosis (Xu

et al, Cell Growth Differ. 1996, 4, 413-418). FAK has been reported to be overexpressed in prostate, breast, thyroid, colon and lung cancers. The level of expression of FAK is directly correlated with tumors demonstrating the most aggressive phenotype.

5    **Angiogenesis or the formation of new blood vessels by sprouting from the preexisting**  
vasculature is of central importance for embryonic development and organogenesis. Abnormal  
enhanced neovascularization is observed in rheumatoid arthritis, diabetic retinopathy and  
during tumor development (Folkman, Nat. Med., 1995, 1, 27-31.). Angiogenesis is a complex  
multistage process which includes activation, migration, proliferation and survival of endothelial  
10    cells. Extensive studies in the field of tumor angiogenesis in the past two decades have identified  
a number of therapeutic targets including kinases, proteases and integrins resulting in the  
discovery of many new anti-angiogenic agents, including KDR inhibitors some of which are  
currently under clinical evaluation (Jekunen, et al Cancer Treatment Rev. 1997, 23, 263-286.).  
Angiogenesis inhibitors may be used in frontline, adjuvant and even preventive settings for the  
15    emergence or regrowth of malignancies.

Several proteins involved in chromosome segregation and spindle assembly have been identified  
in yeast and drosophila. Disruption of these proteins results in chromosome missegregation and  
monopolar or disrupted spindles. Among these kinases are the Ipl1 and aurora kinases from  
20    S.cerevisiae and drosophila respectively, which are required for centrosome separation and  
chromosome segregation. One human homologue of yeast Ipl1 was recently cloned and  
characterized by different laboratories. This kinase termed Aurora2, STK15 or BTAK belongs  
to the serine/threonine kinase family. Bischoff et al showed that Aurora2 is oncogenic and is  
amplified in human colorectal cancers (EMBO J, 1998, 17, 3052-3065). It has also been  
25    exemplified in cancers involving epithelial tumors such as breast cancer.

We have now found a novel group of substituted azaindoles, which have valuable pharmaceutical  
properties, in particular, the ability to inhibit protein kinases, more particularly, the ability to  
selectively inhibit Syk kinase.

"Prodrug" means a compound which is convertible in vivo by metabolic means (e.g. by hydrolysis) to a compound of formula (I), including N-oxides thereof. For example an ester of a compound of formula (I) containing a hydroxy group may be convertible by hydrolysis in vivo to the parent molecule. Alternatively, an ester of a compound of formula (I) containing a carboxy group may be convertible by hydrolysis in vivo to the parent molecule.

Suitable esters of compounds of formula (I) containing a hydroxy group are, for example acetates, citrates, lactates, tartrates, malonates, oxalates, salicylates, propionates, succinates, fumarates, maleates, methylene-bis- $\beta$ -hydroxynaphthoates, gentisates, isethionates, di-p-toluoyltartrates, methanesulfonates, ethanesulfonates, benzenesulfonates, p-toluenesulfonates, cyclohexylsulfamates and quinate.

Suitable esters of compounds of formula (I) containing a carboxy group are, for example, those described by F.J.Leinweber, Drug Metab. Res., 1987, 18, page 379.

Suitable esters of compounds of formula (I) containing both a carboxy group and a hydroxy group within the moiety  $-L^1-Y$  include lactones formed by loss of water between said carboxy and hydroxy groups. Examples of such lactones include caprolactones and butyrolactones.

An especially useful class of esters of compounds of formula (I) containing a hydroxy group, may be formed from acid moieties selected from those described by Bundgaard et. al., J. Med. Chem., 1989, 32, page 2503-2507, and include substituted (aminomethyl)-benzoates, for example dialkylamino-methylbenzoates in which the two alkyl groups may be joined together and/or interrupted by an oxygen atom or by an optionally substituted nitrogen atom, e.g. an alkylated nitrogen atom, more especially (morpholino-methyl)benzoates, e.g. 3- or 4-(morpholinomethyl)-benzoates, and (4-alkylpiperazin-1-yl)benzoates, e.g. 3- or 4-(4-alkylpiperazin-1-yl)benzoates.

Where the compound of the invention contains a carboxy group, or a sufficiently acidic bioisostere, base addition salts may be formed and are simply a more convenient form for use; in practice, use of the salt form inherently amounts to use of the free acid form. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are

non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects inherent in the free base are not vitiated by side effects ascribable to the cations.

Pharmaceutically acceptable salts, including those derived from alkali and alkaline earth metal salts, within the scope of the invention include those derived from the following bases: sodium  
5 hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminium hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, ethylenediamine, N-methyl-glucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chlorprocaine, diethanolamine, procaine, N-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)aminomethane,  
10 tetramethylammonium hydroxide, and the like.

Some of the compounds of the present invention are basic, and such compounds are useful in the form of the free base or in the form of a pharmaceutically acceptable acid addition salt thereof.

15 Acid addition salts are a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free base form. The acids which can be used to prepare the acid addition salts include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects inherent in the free  
20 base are not vitiated by side effects ascribable to the anions. Although pharmaceutically acceptable salts of said basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt  
25 by ion exchange procedures. Pharmaceutically acceptable salts within the scope of the invention include those derived from mineral acids and organic acids, and include hydrohalides, e.g. hydrochlorides and hydrobromides, sulfates, phosphates, nitrates, sulfamates, acetates, citrates, lactates, tartrates, malonates, oxalates, salicylates, propionates, succinates, fumarates, maleates, methylene-bis-b-hydroxynaphthoates, gentisates, isethionates, di-p-toluoyltartrates,  
30 methane-sulfonates, ethanesulfonates, benzenesulfonates, p-toluenesulfonates, cyclohexylsulfamates and quinate.

As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the compounds, for example by exploitation of the  
35 solubility differences between the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

conditions as hereinbefore described, which comprises the administration to the patient of an effective amount of compound of the invention or a composition containing a compound of the invention. "Effective amount" is meant to describe an amount of compound of the present invention effective in inhibiting the catalytic activity a protein kinase, such as Syk, FAK, KDR or Aurora2, and thus producing the desired therapeutic effect.

References herein to treatment should be understood to include prophylactic therapy as well as treatment of established conditions.

The present invention also includes within its scope pharmaceutical compositions comprising at least one of the compounds of the invention in association with a pharmaceutically acceptable carrier or excipient.

Compounds of the invention may be administered by any suitable means. In practice compounds of the present invention may generally be administered parenterally, topically, rectally, orally or by inhalation, especially by the oral route.

Compositions according to the invention may be prepared according to the customary methods, using one or more pharmaceutically acceptable adjuvants or excipients. The adjuvants comprise, inter alia, diluents, sterile aqueous media and the various non-toxic organic solvents. The compositions may be presented in the form of tablets, pills, granules, powders, aqueous solutions or suspensions, injectable solutions, elixirs or syrups, and can contain one or more agents chosen from the group comprising sweeteners, flavourings, colourings, or stabilisers in order to obtain pharmaceutically acceptable preparations. The choice of vehicle and the content of active substance in the vehicle are generally determined in accordance with the solubility and chemical properties of the active compound, the particular mode of administration and the provisions to be observed in pharmaceutical practice. For example, excipients such as lactose, sodium citrate, calcium carbonate, dicalcium phosphate and disintegrating agents such as starch, alginic acids and certain complex silicates combined with lubricants such as magnesium stearate, sodium lauryl sulfate and talc may be used for preparing tablets. To prepare a capsule, it is advantageous to use lactose and high molecular weight polyethylene glycols. When aqueous suspensions are used they can contain emulsifying agents or agents which facilitate suspension. Diluents such as sucrose, ethanol, polyethylene glycol, propylene glycol, glycerol and chloroform or mixtures thereof may also be used.

For parenteral administration, emulsions, suspensions or solutions of the products according to the invention in vegetable oil, for example sesame oil, groundnut oil or olive oil, or aqueous-organic solutions such as water and propylene glycol, injectable organic esters such as ethyl oleate, as well as sterile aqueous solutions of the pharmaceutically acceptable salts, are used. The solutions of the salts of the products according to the invention are especially useful for administration by intramuscular or subcutaneous injection. The aqueous solutions, also comprising solutions of the salts in pure distilled water, may be used for intravenous administration with the proviso that their pH is suitably adjusted, that they are judiciously buffered and rendered isotonic with a sufficient quantity of glucose or sodium chloride and that they are sterilised by heating, irradiation or microfiltration.

For topical administration, gels (water or alcohol based), creams or ointments containing compounds of the invention may be used. Compounds of the invention may also be incorporated in a gel or matrix base for application in a patch, which would allow a controlled release of compound through the transdermal barrier.

For administration by inhalation compounds of the invention may be dissolved or suspended in a suitable carrier for use in a nebuliser or a suspension or solution aerosol, or may be absorbed or adsorbed onto a suitable solid carrier for use in a dry powder inhaler.

Solid compositions for rectal administration include suppositories formulated in accordance with known methods and containing at least one compound of the invention.

The percentage of active ingredient in the compositions of the invention may be varied, it being necessary that it should constitute a proportion such that a suitable dosage shall be obtained. Obviously, several unit dosage forms may be administered at about the same time. The dose employed will be determined by the physician, and depends upon the desired therapeutic effect, the route of administration and the duration of the treatment, and the condition of the patient. In the adult, the doses are generally from about 0.001 to about 50, preferably about 0.001 to about 5, mg/kg body weight per day by inhalation, from about 0.01 to about 100, preferably 0.1 to 70, more especially 0.5 to 10, mg/kg body weight per day by oral administration, and from about 0.001 to about 10, preferably 0.01 to 1, mg/kg body weight per day by intravenous administration. In each particular case, the doses will be determined in accordance with the factors distinctive to the subject to be treated, such as age, weight, general state of health and other characteristics which can influence the efficacy of the medicinal product.

The compounds according to the invention may be administered as frequently as necessary in order to obtain the desired therapeutic effect. Some patients may respond rapidly to a higher or lower dose and may find much weaker maintenance doses adequate. For other patients, it may be necessary to have long-term treatments at the rate of 1 to 4 doses per day, in accordance with the physiological requirements of each particular patient. Generally, the active product may be administered orally 1 to 4 times per day. Of course, for some patients, it will be necessary to prescribe not more than one or two doses per day.

Compounds of the invention may be prepared by the application or adaptation of known methods, by which is meant methods used heretofore or described in the literature, for example those described by R.C.Larock in Comprehensive Organic Transformations, VCH publishers, 1989.

In the reactions described hereinafter it may be necessary to protect reactive functional groups, for example hydroxy, amino, imino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups may be used in accordance with standard practice, for examples see T.W. Greene and P.G.M.Wuts in "Protective Groups in Organic Chemistry" John Wiley and Sons, 1991.

Compounds of formula (I) wherein  $R^1$ ,  $R^2$  and  $R^3$  are as hereinbefore defined, and  $X^1$  is N or CH may be prepared by application or adaptation of the procedures described by Davis et al Tetrahedron, 1992, 48, page 939-952, for example:

(i) reaction of compounds of formula (III):-

wherein  $R^2$  and  $R^3$  are as hereinbefore defined and  $X^1$  is N or CH, with a suitable base, such as lithium diisopropylamide (or butyllithium), in an inert solvent, such as tetrahydrofuran, and at a temperature from about  $-26^{\circ}\text{C}$ ;

(ii) treatment of the resulting anion with nitriles of formula (IV):-

wherein  $R^1$  is as defined hereinbefore at a temperature at about  $-15^\circ\text{C}$  to about room temperature.

This procedure is particularly suitable for the preparation of compounds of formula (I) where  
 5  $R^1$  is optionally substituted N-methylindol-3-yl,  $R^2$  and  $R^3$  are hydrogen and  $X^1$  is N or CH.

Compounds of formula (I) wherein  $R^1$ ,  $R^2$ ,  $R^3$  and  $X^1$  are as hereinbefore defined may also be prepared by application or adaptation of the procedure described by Chang and Bag,  
 J.Org.Chem., 1995, 21, pages 7030-7032, for example reaction of compounds of formula (V):-

The coupling may also be brought about by reaction of compounds of formula (I) containing a carboxy group with N-((dimethylamino)(1H-1,2,3-triazolo[4,5-b]pyridin-1-yl)methylene)-N-methylmethanaminium hexafluorophosphate N-oxide in the presence of a suitable base, such as diisopropylethylamine, in an inert solvent, such as dimethylformamide, and at a temperature at about room temperature, followed by reaction with an amine of formula  $HNY^1Y^2$  (ammonium chloride can be used for the preparation of compounds of formula (I) containing a  $-C(=O)-NH_2$  group).

Inhibitory effects of compounds on Syk kinase were determined using a time-resolved fluorescent assay.

10 The catalytic domain of Syk kinase (residues A340-N635 ) was expressed as a fusion protein in yeast cells and purified to homogeneity. Kinase activity was determined in 50mM Tris-HCl buffer pH 7.0 containing 50mM NaCl, 5mM MgCl<sub>2</sub>, 5mM MnCl<sub>2</sub>, 1μM adenosine triphosphate and 10μM synthetic peptide Biotin-( β-Alanine)<sub>3</sub>-DEEDYEIPP-NH<sub>2</sub>. Enzyme reactions were terminated by the addition of buffer containing 0.4M KF, 133mM EDTA, pH 7.0, containing a  
15 streptavidin-XL665 conjugate and a monoclonal phosphospecific antibody conjugated to a europium cryptate (Eu-K). Features of the two fluorophores, XL-665 and Eu-K are given in G.Mathis et al., Anticancer Research, 1997, 17, pages 3011-3014. The specific long time signal of XL-665, produced only when the synthetic peptide is phosphorylated by Syk, was measured on a Packard Discovery Microplate analyzer. Inhibition of syk activity with compounds of the

Particular compounds of the invention inhibit syk activity with IC<sub>50</sub>s in the range 100 micromolar to 10 nanomolar. Preferred compounds of the invention inhibit syk activity with IC<sub>50</sub>s in the range 100 nanomolar to 10 nanomolar.

##### **2.1 Cell culture, labelling of RBL-2H3 cells and performance of assay.**

30 For each 24-well culture plate to be set up, 6 x 10<sup>6</sup> cells RBL-2H3 cells were washed and resuspended in 15 mL DMEM-10 containing 25μl of 1mCi/ mL [<sup>3</sup>H]-serotonin (0.5μCi/ mL final concentration) and 1μg/ mL (15 mL) of anti-DNP IgE. 0.5 mL of cell suspension was added into each well of a 24-well plate. Cells were incubated for 2 days at 37°C, until they have reached confluence. The medium was gently aspirated from each well and the cells were then washed  
35 with assay buffer. A final volume of 200 mL of assay buffer (+ or - the test compounds at the

appropriate concentrations) was then added to each of three replicate wells. 100ng/ mL of DNP (antigen) was then added to all wells (excluding negative control wells i.e. to measure spontaneous [<sup>3</sup>H]-serotonin release in the absence of receptor cross-linking). The cells were incubated for 30 minutes at 37°C and the reaction was stopped by transferring 100µl of the supernatant from each sample into a liquid scintillation microtitre plate kept on ice. 200µl of scintillant-40 was then added to each well of the microtitre plate and the plate was read on a Topcount Liquid Scintillation Counter.

## 2.2 Calculation of results

- (i) The mean  $\pm$  s.e.m. of each set of triplicate wells was calculated.
- (ii) Maximum response was the positive control wells containing antigen (10ng/ mL) but no compound.
- (iii) Minimum response was the control wells containing no antigen and no compound.
- (iv) Using these values as the maximum (100%) and minimum (0%) values respectively, the data was normalised to give a percentage of the maximum response.
- (v) A dose response curve was plotted and the IC<sub>50</sub> of the compound was calculated.

Compounds of the invention inhibit antigen-induced degranulation of Rat Basophilic leukemia (RBL) cells with EC<sub>50</sub>s in the range 100 micromolar to 0.01 micromolar.

Inhibitory effects of compounds on KDR-substrate phosphorylation assay - were determined using a flashplate ( 96-multiwell plates, New England Nuclear) assay.

The cytoplasmic domain of human enzyme has been cloned as glutathione S-transferase (GST) fusion into the pFastBac-GST tagged (reading frame) B baculovirus expression vector. The protein has been expressed in SF21 cells and purified to about 60% homogeneity.

Kinase activity was determined in 20mM 4-morpholinepropanesulfonic acid sodium salt, 10mM MgCl<sub>2</sub>, 10mM MnCl<sub>2</sub>, 1mM Dithiothreitol, 2.5mM ethyleneglycol-bis (beta-aminoethylether)-N,N'-tetraacetic acid, 10mM  $\beta$ -glycerophosphate, pH 7.2 containing 10 mM MgCl<sub>2</sub>, 100  $\mu$ M

Na<sub>3</sub>VO<sub>4</sub>, 1mM NaF. 10 µl of compound were added to 70µl of kinase buffer containing 100ng of Kinase Domain Receptor (KDR) enzyme at 4°C. Reaction was started by addition of 20µl of solution containing 2µg of substrate (SH2-SH3 fragment of PLCγ expressed as GST fusion protein), 2µCi γ<sup>33</sup>P[ATP] and 2µM cold ATP. After 1h incubation at 37°C, reaction was stopped by addition of 1 volume (100µl) of 200mM EDTA. The assay buffer was then discarded and the wells washed three fold with 300 µl of phosphate buffered saline. Radioactivity was measured in each well using a Packard Model Top Count NXT instrument.

Background signal was deduced from the measurement of radioactivity in quadruplate wells containing radioactive ATP and substrate alone in kinase buffer.

Control activity was deduced from the measurement of radioactivity of quadruplate wells containing the complete assay cocktail (γ<sup>33</sup>P-[ATP], KDR and PLCγ substrate) in the absence of test compound.

Inhibition of KDR activity with compound of the invention was expressed as percentage inhibition of control activity exhibited in the absence of test compound.

SU5614 1µM (Calbiochem) was included in each plate in quadruplate as a control of inhibition. IC<sub>50</sub>'s were calculated for compounds of the invention by plotting a dose-response curve. IC<sub>50</sub> corresponded to the concentration of compound of the invention that induced a 50% inhibition of kinase activity.

Particular compounds of the invention inhibit KDR activity with IC<sub>50</sub>s in the range 100 micromolar to 0.3 micromolar.

## 2. Cellular activity on endothelial cell

2.1 Inhibition of Vascular endothelial growth factor (VEGF)-dependent human dermal microvascular endothelial cells (HDMEC) proliferation.

The anti-KDR activity of the molecules of the invention was evaluated by [<sup>14</sup>C]-thymidine uptake on HDMEC (Human Dermal Microvascular Endothelial Cell) in response to VEGF.

HDMEC (Promocell, passage 5 to 7) were seeded in 100µl at 5,000 cells per well in Cytostar 96-multiwell plates (Amersham) precoated with Attachment factor (AF, Cascad Biologics) at 37°C, 5% CO<sub>2</sub>, at day 1. On day 2, complete cell medium (Basal medium supplemented with 5% of Fetal calf serum (FCS) and cocktail of growth factors) was replaced by minimum medium (basal medium supplemented with 5% of FCS) and cells were incubated for another 24h. On day 3, medium was replaced by 200 µl of fresh minimum medium supplemented or not with 100 ng/ml VEGF (R&D System) and containing or not compounds of the invention and 0.1µCi [<sup>14</sup>C]-

thymidine. Cells were incubated at 37°C, 5% CO<sub>2</sub> for 4 days. [<sup>14</sup>C]-thymidine uptake was then quantified by counting the radioactivity. Assays were performed in three replicate wells. The final concentration of DMSO in the assay is 0.1%. The % inhibition is calculated as  $[\text{cpm}_{(+\text{VEGF})} - \text{cpm}_{(+\text{VEGF} + \text{cpd})} / \text{cpm}_{(+\text{VEGF})} - \text{cpm}_{(\text{BM5\%FCS})}] \times 100$ .

## 2.2 Effect of molecules on VEGF-independent HDMEC growth :

HDMEC (5,000 cells per well) are seeded in complete medium (CM) in Cytostar 96-multiwell plates (Amersham) precoated with Attachment factor (AF, Cascad Biologics) at 37°C, 5% CO<sub>2</sub>, at day 1. Complete medium is then removed and cells are incubated in 200µl of complete medium containing molecules of the invention and [<sup>14</sup>C]-thymidine (0.1µCi) . The uptake of [<sup>14</sup>C]-thymidine is quantified using Wallac betaplate after 3 days of incubation. The % inhibition is calculated as  $[\text{cpm}_{(\text{CM})} - \text{cpm}_{(\text{CM} + \text{cpd})} / \text{cpm}_{(\text{CM})}] \times 100$ .

## 15 C. IN VITRO TEST PROCEDURES FOR AURORA2

### 1. Inhibitory effects of compounds on Aurora2 kinase

Inhibitory effects of compounds on Aurora2 kinase were determined using a nichel-chelate flashplate radioactive assay.

20

N-terminally His-tagged full length recombinant aurora2 was expressed in *E.coli* and purified to near homogeneity.

N-terminally His-tagged NuMA (Nuclear protein that associates with the Mitotic Apparatus) C-terminal fragment (Q1687-H2101) was expressed in *E.coli*, purified by nichel chelate chromatography and used as substrate in Aurora2 kinase assay. For kinase activity determination NuMAsubstrate was freshly equilibrated in kinase buffer (50 mM Tris-HCl, pH7.5, 50 mM NaCl, 10 mM MgCl<sub>2</sub>) supplemented with 10% (v/v) glycerol and 0.05% (w/v) NP40 by chromatography on a Pharmacia PD10 column.

25

30

The kinase activity of Aurora2 was measured in a nichel chelate flashplate (New England Nuclear, model SMP107). Each well contained 100 µl of the following solution : 0.02 µM Aurora2 ; 0.5 µM NuMAsubstrate ; 1 µM ATP supplemented with 0.5 µCi[γ-<sup>33</sup>P]- ATP. The solutions were incubated for 30 minutes at 37 °C. The assay buffer was then discarded and the wells rinsed twice with 300 µl of kinase buffer. Radioactivity was measured in each well using a Packard Model Top Count NXT instrument.

35

Background signal was deduced from the measurement of radioactivity in duplicate wells containing radioactive ATP alone in kinase buffer treated in the same manner as other samples. Control activity was deduced from the measurement of radioactivity of duplicate wells containing the complete assay cocktail (ATP, Aurora2 and NuMA substrate) in the absence of test compound.

Inhibition of Aurora2 activity with compound of the invention was expressed as percentage inhibition of control activity exhibited in the absence of test compound. Staurosporin was included in each plate as a control of inhibition.

IC<sub>50</sub>'s were calculated for compounds of the invention by plotting a dose-response curve. IC<sub>50</sub> corresponded to the concentration of compound of the invention that induced a 50% inhibition of kinase activity.

Particular compounds of the invention inhibit Aurora2 activity with IC<sub>50</sub>s in the range 100 micromolar to 0.3 micromolar.

### C. IN VITRO TEST PROCEDURES FOR FAK

#### 1. Inhibitory effects of compounds on FAK

Inhibitory effects of compounds on FAK kinase – autophosphorylation assay - were determined using a time-resolved fluorescent assay.

The full length cDNA of human enzyme has been cloned into the pFastBac HTc baculovirus expression vector. The protein has been expressed and purified to about 70% homogeneity.

Kinase activity was determined in 50 mM Hepes pH 7.2 containing 10 mM MgCl<sub>2</sub>, 100 μM Na<sub>3</sub>VO<sub>4</sub>, 15 μM adenosine triphosphate. Enzyme reactions were terminated by the addition of Hepes buffer pH 7.0, containing 0.4 M KF, 133 mM EDTA, BSA 0.1% containing an anti-6His antibody labelled with XL665 (FAK is His-tagged) and a monoclonal tyrosine phosphospecific antibody conjugated to a europium cryptate (Eu-K). Features of the two fluorophores, XL-665 and Eu-K are given in G.Mathis et al., Anticancer Research, 1997, 17, pages 3011-3014. The specific long time signal of XL-665, produced only when the FAK enzyme is autophosphorylated, was measured on a Packard Discovery Microplate analyzer. Inhibition of FAK activity with compounds of the invention was expressed as percentage inhibition of control activity exhibited in the absence of test compounds.

**2. Proliferation/viability of human melanoma SK-Mel-28 cells as measured by [<sup>14</sup>C] Thymidine uptake**

**2.1 Cell culture, labelling of SK-Mel-28 cells and performance of assay.**

SK-Mel-28 were seeded at 5,000 cells per well in Cytostar 96-multiwell plates (Amersham) at 37°C, 5% CO<sub>2</sub>, at day 1. On day 2, cell medium was replaced by fresh Eagle's minimum essential medium (MEM) culture medium supplemented with 10 % FCS, 1% non essential amino acids, 1 % sodium pyruvate and containing 0.1 µCi of [<sup>14</sup>C]-Thymidine plus increasing concentrations of compounds in a 200 µl final volume. Cells were incubated at 37°C, 5% CO<sub>2</sub> for 48 hours. [<sup>14</sup>C]-Thymidine uptake was quantified by counting the radioactivity 48 hours after initiation of treatment. Assays were performed in three replicate wells.

**2.2 Calculation of results**

- (i) The mean  $\pm$  s.e.m. of each set of triplicate wells was calculated.
- (ii) Maximum response was the positive control wells containing cells but no compound.
- (iii) Minimum response was the control wells containing no cell and no compound.
- (iv) Using these values as the maximum (100%) and minimum (0%) values respectively, the data were normalized to give a percentage of the maximum response.
- (v) A dose response curve was plotted and the IC<sub>50</sub> (the concentration of drug that induces a 50% decrease in [<sup>14</sup>C]-thymidine uptake) of the compound was calculated.

**3. Migration of human melanoma SK-Mel-28 cells on Fibronectin matrix**

**3.1 Cell culture and performance of assay.**

SK-Mel-28 (250,000 cells ) were pretreated with increasing concentrations of compounds for 15 min at 37°C, 5 % CO<sub>2</sub>. They were then loaded in presence of the compound on the upper side of 12 µm 12-multiwell chemotaxis Boyden chambers (Becton Dickinson) and allowed to migrate to the lower chamber containing fibronectin (10 µg/ml) as chemoattractant in basal RPMI culture medium for 24 hours at 37°C, 5 % CO<sub>2</sub>. Cells were then fixed and stained in Diff-Quick (Diff-Quick Fix, I and II solutions, Dade Behring) and cells from the upper side of the chamber were removed. Stain was solubilized from lower side adherent cells and cell migration was quantified by optic density measurement. Assays were performed in two replicate wells.

### 3.2 Calculation of results

- (i) The mean  $\pm$  s.e.m. of each set of duplicate wells was calculated.
- 5 (ii) Maximum response was positive control wells containing cells but no compound and allowed to migrate on fibronectin.
- (iii) Minimum response was the control wells containing cells but no compound and allowed to migrate on basal culture medium w/o chemoattractant.
- (iv) Using these values as the maximum (100%) and minimum (0%) values respectively, the data
- 10 were normalized to give a percentage of the maximum response.
- (v) A dose response curve was plotted and the IC<sub>50</sub> (the concentration of drug that induces a 50% decrease in cell migration) of the compound was calculated.

Particular compounds of the invention inhibit FAK activity with IC<sub>50</sub>s in the range 100

15 micromolar to 0.3 micromolar.

### IN VIVO TEST PROCEDURES

20 1. Inhibition of antigen induced airway inflammation – single-and multiple-day oral dosing studies.

Compounds of the invention were assessed in the allergic Brown Norway rat. The models used in these in vivo studies mimic relevant pathological features of allergic airway disease. These studies demonstrated that compounds of the invention inhibit the accumulation of inflammatory cells in the airways allergic twenty-four hours after antigen inhalation. The endpoints measured

25 included the appearance of inflammatory leukocytes in the bronchoalveolar lavage fluid (BALF), lung digest fluid, and in the tissue as quantified by histopathological analysis.

#### Protocol for sensitization and challenge

Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100 $\mu$ g, i.p)

30 administered with aluminum hydroxide (100 mg, i.p). On day 30, the rats were exposed to a 1% aerosol of ovalbumin for a period of 30 minutes. The animals were then returned to housing.

#### Protocol for Dosing

Test drug was administered orally 1 hour before the initiation of the allergen inhalation

35 challenge. Four hours after the end of the antigen inhalation challenge, a second dose of drug

-253-

was given orally. Doses of compound were administered at half log divisions between 3 and 100 mg/kg.

In separate studies drug was administered two times daily for 4 days before the inhalation of antigen. The final dose of compound in these studies was also given at 4 hours after the antigen challenge.

#### Protocol for Bronchoalveolar lavage (BAL) recovery

Twenty-four hours after the antigen inhalation challenge, cells were recovered from the airway lumen by bronchoalveolar lavage by euthanizing the animals, and washing the lungs with three 5-ml aliquots of RPMI/FCS. The washes were allowed to remain in the lungs for 30 seconds each before gentle removal. The three samples were pooled and total and differential white blood cell counts were measured on BAL samples. An ARGOS system was used to assess total cells and differential cell counts were made using light microscopy of Wright-Giemsa stained cytocentrifuge preparations.

#### Protocol for Histopathology of lungs

Immediately after BAL, the lungs were insufflated with 10% neutral buffered formalin (NBF), at 30cm water pressure. The lungs were removed and placed in jars of 10% NBF. After fixation in 10% NBF for a minimum of 24 hours the lungs were processed through graded alcohol and into wax locks. The lungs were blocked longitudinally and one 2 µm longitudinal section for each animal was cut at the level of the main bronchi. Sections were then stained with haematoxylin and eosin. Pathological assessment of sections was performed and a grading for the bronchiolar epithelium and sub-mucosa was assigned

#### Protocol for lung digest

In some studies the lung itself was digested, to recover the inflammatory cells localized within the tissue. In these studies the cells were obtained by perfusing the left lung with RPMI/FCS in order to remove the blood pool of cells immediately after BAL. In the se studies the he right hand side of the lung was insufflated and fixed with buffered formalin for histopathological analysis. The lung to undergo digestion was standardized across animals by taking a 300mg the section of the lung tissue and exposing it to collagenase digestion. This freed the cells within the lung tissue and allowed their recovery. Total and differential cell counts were performed on these recovered cells.

**Results**

(i) Following antigen inhalation there was a significant increase in the numbers of eosinophils and neutrophils in the non-drug treated groups. This was evidenced by the significant increase in BAL and tissue digest eosinophil and neutrophil numbers as well as the lung histopathology score.

(ii) No changes in BAL macrophage/monocyte cell numbers were observed with antigen challenge or with any drug treatment.

(iii) The compound was able to inhibit significantly the infiltration of neutrophils and eosinophils 24 hours after antigenic challenge compared to the non-drug treated controls as assessed in all three methods noted above. The dose range for efficacy was between 3 and 100 mg/kg po.

(iv) In the multiple-day drug administration studies, there was quantitatively similar inhibition of the cellular influx as seen in the single day studies.

These results indicate that compounds of the invention demonstrate anti-inflammatory activity when given prophylactically in a rat model of antigen induced leukocyte infiltration

**2. Inhibition of antigen induced airway inflammation –single-day ip dosing studies****Protocol for sensitization and challenge**

Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100µg, i.p) administered with aluminum hydroxide (100 mg, i.p). On day 30, the rats were exposed to a 1% aerosol of ovalbumin for a period of 30 minutes. The animals were then returned to housing.

**Protocol for Dosing**

Test drug was administered four times intraperitoneally rather than po. The dosing regimen was 30 min pre-challenge and 2, 4 and 8 hours after allergen inhalation challenge.

**Protocol for Bronchoalveolar lavage (BAL) recovery**

Twenty-four hours after the antigen inhalation challenge, cells were recovered from the airway lumen by bronchoalveolar lavage by euthanizing the animals, and washing the lungs with three 5-ml aliquots of RPMI/FCS. The washes were allowed to remain in the lungs for 30 seconds each before gentle removal. The three samples were pooled and total and differential white blood cell counts were measured on BAL samples. Pathological assessment of sections was performed and a grading for the bronchiolar epithelium and sub-mucosa was assigned

**Protocol for lung digest**

In some studies the lung itself was digested, to recover the inflammatory cells localized within the tissue. In these studies the cells were obtained by perfusing the left lung with RPMI/FCS in order to remove the blood pool of cells immediately after BAL. In the same studies the right hand side of the lung was insufflated and fixed with buffered formalin for histopathological analysis. The lung to undergo digestion was standardized across animals by taking a 300mg section of the lung tissue and exposing it to collagenase digestion. This freed the cells within the lung tissue and allowed their recovery. Total and differential cell counts were performed on these recovered cells.

**Results**

(i) Following antigen inhalation there was a significant increase in the numbers of eosinophils and neutrophils in the non-drug treated groups. This was evidenced by the significant increase in BAL and tissue digest eosinophil and neutrophil numbers as well as the lung histopathology score.

(ii) Compounds of the invention were able to inhibit significantly the infiltration of neutrophils and eosinophils 24 hours after antigenic challenge compared to the non-drug treated controls as assessed in all three methods noted above. The dose range for efficacy was between 3 and 100 mg/kg po.

These results indicate that compounds of the invention demonstrate anti-inflammatory activity when given prophylactically in a rat model of antigen induced leukocyte infiltration either orally or intraperitoneally.

**3. Inhibition of acute antigen induced bronchoconstriction in the allergic rat**

**Protocol for sensitization and challenge**

Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100µg, i.p) administered with aluminum hydroxide (100 mg, i.p). On the day of study the rats were surgically prepared for the measurement of pulmonary mechanics and mechanically ventilated.

- 5 After a five-minute equilibration period, the animals received a bolus of ovalbumin (1 mg per rat). The animals were then followed for 15 minutes and peak changes from base line resistance recorded as the response to antigen challenge.

**Protocol for Dosing**

- 10 Test drug was given either p.o. or i.p. 24 and 2 hours before the iv bolus injection of ovalbumin. The range of compound delivered in these studies was 10-100 mg/kg po.

**Results**

- 15 Following antigen challenge in the non-drug treated and budesonide control-treated animals there was a significant increase in the airway resistance over baseline. In contrast, compounds of the invention significantly inhibited the antigen-induced bronchoconstriction.

These results indicate that compounds of the invention inhibit antigen-induced bronchoconstriction.

20

**4. Inhibition of Sephadex induced rat lung edema and cytokine gene expression in the allergic rat****Protocol for Sephadex administration**

- 25 Male Sprague-Dawley rats (400 g), were dosed i.t. with vehicle (saline) or Sephadex (5mg/kg) in a dose volume of 1ml/kg under halothane anesthesia (4% in oxygen for 3 min).

**Protocol for Dosing**

- 30 Drug was administered p.o. 1 hour before and 5 hours after Sephadex i.t in a dose volume of 1ml/kg..

**Protocol for Assessing edema as an endpoint**

- 35 Twenty-four hours after Sephadex administration the animals were sacrificed with Euthatal (1ml/kg i.p.), the heart and lungs removed *en bloc*. An increase in wet weight was used as an index of edema. The wet weight determined and then corrected for 100g initial body weight.

**Protocol for RT-PCR (measurement of cytokine gene expression)**

RNA was isolated from lung tissue by a guanidium thiocyanate-phenol-chloroform extraction technique. RNA was reverse transcribed to cDNA using AMV reverse transcriptase. cDNA for IL-5, IL-4, eotaxin and GAPDH (control gene) were amplified by PCR using oligonucleotide sequences synthesized (Gibco) from published sequences.

5

The PCR reagents were overlaid with mineral oil and amplification was carried out through 25-35 cycles of denaturation at 95°C for 1 minute, annealing at 55-65°C for 1 minute and extending at 72°C for 7 minutes. The PCR products, stained with ethidium bromide, were electrophoresed in 2% agarose gels to visualize cDNA bands.

10

Bands of each target fragment were visualized by ultraviolet transillumination and photographed. Photographs were scanned on a densitometer and integrated optical densities (OD x mm) of each band were calculated by image analysis software (Imagemaster, Pharmacia). For each animal, the amount of each cytokine PCR product was normalized to the amount of GAPDH PCR product.

15

### Results

- (i) Sephadex instillation alone evoked a significant edema of 32%
- (ii) Compounds of the invention inhibited the edema in a dose dependant manner by at doses of 10, 30 and 100mg/kg
- (iii) Sephadex caused an increased expression of the Th-2 cytokines IL-4 and IL-5 together with the CC chemokine eotaxin in the lung 24 hours after challenge. There was a trend toward an increase in the expression of IL-5 and eotaxin mRNA.
- (iv) IL-4 mRNA expression was dose dependently inhibited by compounds of the invention.

25

Compounds of the invention inhibit Sephadex induced lung edema in the rat, which is associated with a reduction in Sephadex induction of IL-4.

### 5. Inhibition of antigen-induced histamine release in the allergic Brown-Norway rat

30

#### Protocol for sensitization and challenge

Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100µg, i.p) administered with aluminum hydroxide (100 mg, i.p). On the day of study, the rats were surgically prepared for the infusion of antigen. After a five-minute equilibration period, the animals received a bolus of ovalbumin (1 mg per rat). Blood samples were taken 2 minutes after ovalbumin challenge and plasma histamine levels were measured using a histamine ELISA.

35

**Protocol for Dosing**

Test drug was given i.p. 30 min before ovalbumin challenge. Only a single 30 mg/kg i.p. concentration was used in this study

5

**Results**

Following antigen challenge, the Syk Kinase inhibitors significantly inhibited the antigen-induced histamine release in comparison to the vehicle treated group.

10 These results indicate that compounds of the invention inhibit antigen-induced histamine release.

**6. Inhibition of ED-1+ alveolar macrophages in rat lung tissue**

15 **Protocol for sensitization and challenge**

Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100µg, i.p) administered with aluminum hydroxide (100 mg, i.p). On day 30, the rats were exposed to a 1% aerosol of ovalbumin for a period of 30 minutes. The animals were then returned to housing.

20 **Protocol for Dosing**

Test drug was given either p.o. or i.p. 24 and 2 hours before the iv bolus injection of ovalbumin. The range of compound delivered in these studies was 10-100 mg/kg po.

**Protocol for ED1 quantification**

25 Alveolar macrophages were quantified following immunostaining with ED-1 antibody in paraffin-embedded lung tissue sections.

**Results**

30 (i) Ovalbumin challenge resulted in a 10-fold increase in the number of ED1+ macrophages in the alveolar bed.

(ii) Inhibition of Syk Kinase significantly reduced the ovalbumin-induced increase in ED1 alveolar macrophages in a dose-dependent manner.

35 Oral administration of compounds of the invention produced a dose-related reduction in ED-1+ alveolar macrophages following ovalbumin challenge.

5    **7. Inhibition of antigen-induced airway neutrophilia in the Brown-Norway rat**

**Protocol for sensitization and challenge**

     Brown Norway rats were sensitized on days 0, 12 and 21 with ovalbumin (100µg, i.p)  
administered with aluminum hydroxide (100 mg, i.p). On day 30, the rats were exposed to a 1%  
10    aerosol of ovalbumin for a period of 30 minutes. The animals were then returned to housing.

**Protocol for Drug dosing**

     One hour before antigen challenge, rats were dosed orally. The range of compound delivered in  
these studies was 1-100 mg/kg po.

15    **Protocol for cell analysis**

     Four hours after challenge, cells were recovered from the airway lumen by bronchoalveolar  
lavage (RPMI/FCS as previously described). Immediately after lavage, lungs were perfused with  
RPMI/FCS to remove the blood pool of cells. 300 mg of tissue was chopped and cells were  
20    recovered by enzymatic (collagenase) disaggregation. Differential cell counts were made by light  
microscopy of stained cytocentrifuge preparations stained with Wright-Giemsa stain.

**Results**

25    (i)    Four hours after antigen challenge a significant increase in neutrophils was observed in  
both the BAL and lung tissue.

     (ii)    The ovalbumin-induced increase in neutrophils in the BAL, but not the lung tissue, was  
significantly suppressed by compounds of the invention.
